There are three main ways that molecules can pass through a phospholipid membrane. The first way requires no energy input by the cell and is called passive transport. The second way requires that the cell uses energy to pull in or pump out certain molecules and ions and is called active transport.

Homeostasis and Cell Transport. Homeostasis is the process by which cells maintain the internal conditions that they need to support life. This can be generalized to the heat that our bodies generate to keep us warm and support chemical reactions or the microscopic movements of molecules across cell membranes. This is what powers that larger changes that keep our bodies in equilibrium. Homeostasis

The two mechanisms by which molecules are transported across the cell membrane are active transport and passive transport. Active transport requires the expenditure of energy while passive results from the random movement of molecules. Osmosis and diffusion are two types of passive transport. In osmosis, water moves from areas of greater concentration to a lesser concentration until equilibrium is reached.
